Adobe Japan — Web Experience & A/B Testing

My Role	Web Product Manager (Contract)
Company	Adobe Japan — adobe.com/jp
Period	January 2025 – Present
Scope	Homepage · Catalogue · Plans page · Campaign pages
Tools	Adobe Analytics · Contentsquare · Figma · CMS · A/B testing platform

● BUSINESS CONTEXT & CHALLENGE

Adobe Japan's website is the primary conversion channel for Creative Cloud subscriptions in Japan — a market with distinct user behaviours, reading patterns, and purchasing decision processes compared to Western audiences. My role covers end-to-end web ownership: from identifying UX friction through data analysis, to designing experiments, coordinating global delivery, and reporting business impact.

Localisation gap	Global page templates optimised for Western users underperformed in Japan — requiring identification of specific friction points and targeted localised improvements.
GenAI comprehension	As Adobe introduced generative AI credits into Creative Cloud plans, behavioural data revealed significant confusion at the point of purchase — users did not understand what credits were or what happened when they ran out. This was suppressing conversion on the plans page.
Cross-functional complexity	Every improvement required coordination across global development, CMS, design, analytics, and paid media teams across multiple time zones — with Japan as a regional stakeholder, not the decision-making centre.

● MY PROCESS

01	02	03	04	05
Analyse	Identify	Propose	Collaborate	Deliver
Adobe Analytics + Contentsquare to identify friction & user confusion	Pinpoint specific sections causing drop-off at plan selection	Develop solution within global template & brand constraints	Work with JP marketing team + vendor to produce localised content	Coordinate CMS implementation, QA, release & performance tracking

● FEATURED PROJECT — GENAI CREDIT COMPREHENSION A/B TEST

Problem Identification

Contentsquare session data and user feedback revealed that Japanese users on the Creative Cloud plans page were confused by the GenAI credit comparison between plans. The existing chart lacked clarity around what credits were, how Standard vs Premium features differed, and what each plan actually enabled — leading to hesitation and abandonment at the plan selection step.

My Contribution

I proposed and led the redesign of the GenAI comparison chart and the use cases section directly below it — the two sections that sit at the critical decision point where users choose between Creative Cloud and Creative Cloud Pro. Working within global page template restrictions, I collaborated with the Japan marketing team and content vendor to:

- Restructure the comparison chart to clearly differentiate Standard vs Premium GenAI features and credit allocation per plan
- Add Japanese-localised use case examples below the chart — helping users understand what they could actually create with each tier
- Ensure all copy and visual elements remained within Adobe's global brand and template guidelines

– Coordinate implementation across CMS and global development teams within Japan's localisation constraints

GenAI comparison chart — CC vs CC Pro plan features

Use cases section — localised examples below the chart

Result

Improved comprehension of GenAI credit differences between plans at the key conversion decision point — contributing to the projected QARR uplift.

● ADDITIONAL PROJECT — FIREFLY JAPAN FEATURE PAGES CULTURALISATION

Alongside the plans page work, I identified and led a culturalisation initiative across multiple Adobe Firefly Japan feature pages — including the text-to-image and AI video generator pages.

What I Worked On

Marquee gallery	The hero image galleries (marquees) at the top of each feature page showed global imagery that did not resonate with Japanese users. I proposed and coordinated the replacement of these images with Japan-relevant content — anime-style illustrations, Japanese urban scenes, cherry blossoms — that immediately communicated Firefly's creative capabilities in a culturally familiar context.
Generation examples	I increased the number and quality of generation examples shown on each page, working with the content vendor to produce Japanese-language prompt examples and locally relevant generated outputs — making it immediately clear to Japanese users what they could create.
App referrals	I expanded and optimised the related feature card sections at the bottom of each page, improving cross-linking between Firefly capabilities (text-to-image, image-to-image, style transfer, Firefly board) with Japanese-culturalised imagery in each card — increasing feature discoverability and engagement.

Constraints & Collaboration

All changes were implemented within Adobe's global page template and brand guidelines — no structural changes were permitted. The solution required identifying exactly which content elements could be localised within those constraints, then collaborating with the Japan marketing team and content vendor to source, adapt, and implement appropriate assets.

Result	Increased generation engagement and app referral clicks across Firefly Japan pages — demonstrating that culturalisation within global constraints meaningfully improves user engagement metrics.

● CROSS-FUNCTIONAL DELIVERY

Beyond experimentation, my day-to-day role involves orchestrating end-to-end delivery of Japan web initiatives across a complex global team structure:

Requirements	Translate Japan marketing and product launch goals into clear web execution briefs
Localisation	Align global content with Japan market needs — language, tone, cultural nuance, legal compliance
QA & Release	Coordinate quality assurance, release scheduling, and post-launch performance monitoring
Analytics	Track KPIs using Adobe Analytics and Contentsquare; report insights to JP and global stakeholders
Stakeholder Mgmt	Maintain trusted relationships with US HQ, Japan marketing team, and regional agency partners

● REFLECTION & LEARNINGS

This role deepened my ability to connect UX decisions directly to business outcomes. The most valuable shift has been framing every web improvement as a business case — with projected revenue impact — rather than a design improvement alone. This builds stakeholder trust and accelerates approval cycles. Operating at the intersection of Japan market needs and global platform constraints has also sharpened my skill in finding pragmatic, high-impact solutions within structured systems.

Medicus Practice — Landing Page Design

My Role	UI/UX Designer (Freelance)
Client	Medicus Practice — Austria
Period	2023 – 2024
Scope	Full landing page system · Web shop · HCP inquiry flow · Partnership pages
Tools	Figma · Adobe Illustrator · Adobe Photoshop

● BUSINESS CHALLENGE

Medicus Practice is an innovative Austrian healthcare platform enabling independent physicians and therapists to operate flexibly, digitally, and with full practice infrastructure — a fundamentally new model in the Austrian healthcare market. The challenge was to design a landing page system that communicated this complex, unfamiliar proposition clearly, while driving two distinct conversion goals: patient appointment bookings and healthcare professional (HCP) network inquiries.

Brand differentiation	User testing confirmed users initially mistook the platform for a standard appointment booking site. The design needed to clearly communicate a premium, innovative healthcare service — not a transactional utility.
Dual audience	Patients and HCPs have fundamentally different needs, goals, and decision journeys. Navigation and content architecture had to serve both without confusion or compromise.
Information architecture	A complex service offering — specialisations, locations, bookable courses, web shop, and HCP partnership — required a clear structure to prevent information overload.
Specialty discovery	Users reported difficulty finding specific specialties during testing — a critical friction point requiring a dedicated design solution.

● DESIGN PROCESS

01	02	03	04	05
Research	Define	Ideate	Test	Design
Competitor analysis of medical sites + low-fidelity wireframes	Finalised IA, colour system & typography choices	Multiple layout iterations to solve UX problems identified	Usability & A/B testing; gathered navigation & comprehension feedback	Finalised all screens; submitted Figma prototype for handoff

● KEY DESIGN DECISIONS

Visual identity	Deep forest green (#215045) with gold accents (#DBA805) — selected to convey clinical trust, premium positioning, and warmth. Cormorant Garamond headings signal quality; Neue Einstellung body text ensures legibility.
Navigation architecture	Separated patient and HCP journeys at top-level nav — preventing audience confusion while serving both conversion goals from the same homepage entry point.
Resolving misinterpretation	Responded to user testing finding by introducing distinct visual sections, unique icons, and copy that emphasised the practice room and professional network — rather than leading with booking.
HCP inquiry UX	Designed a 5-step visual onboarding flow (Inquire → Consult → Appoint → Tour → Sign) to reduce perceived friction and set clear expectations for HCPs considering joining.
Specialty discovery	Resolved testing-identified friction with filterable specialty cards and a persistent location-based selector — enabling users to find relevant specialists without page reloads.

User Testing & Final Screens

● USER TESTING

Methods

- Usability testing sessions — observed navigation and service comprehension
- A/B testing — compared layout variants on critical conversion elements
- Task-based testing — find specific specialty, complete booking flow

Findings & Applied Insights

- Booking site confusion → Added distinct visuals and icons differentiating the platform
- Specialty discovery gap → Introduced filterable cards with location selector
- HCP journey unclear → Separate nav path and 5-step visual onboarding flow
- Need for guidance → Interactive tooltips explaining services contextually

● SELECTED FINAL SCREENS

Homepage Patient entry - hero + specialisations

Specialisation page Filtered by specialty + location

Location page Practice detail + map + directions

About Us Team + values + CTA

HCP Inquiry 5-step onboarding journey

Web shop Product categories + featured items

● OUTCOME & REFLECTION

Delivered a complete multi-page design system covering all patient and HCP journeys — from homepage through specialisation directory, location pages, HCP inquiry, and web shop. The project required end-to-end capability: information architecture, visual design, component systems, image retouching in Photoshop, and logo adaptation in Illustrator, all delivered as a Figma prototype ready for developer handoff.

Key learning: designing for a dual audience requires disciplined IA decisions early. The temptation is to surface everything — the discipline is in deciding what each audience needs to see first, and building navigation that respects both journeys without compromise. User testing proved essential in catching misinterpretation issues that would not have been visible from the design alone.

Let's work together.

Available for Web Product Manager and Digital Experience roles in Tokyo including permanent and contract /
Haken positions.
